As the seedship enters the new system's outer cometary cloud, the collision-avoidance system detects a fast-moving comet surrounded by a cloud of smaller ice fragments. The large comet is on a collision course with the landing system. The seedship could avoid it entirely, but it would then hit one of the smaller fragments, and the collision-avoidance system cannot predict which part of the ship that fragment would hit.

Avoid the comet

Allow it to hit the landing system
