Observatory
You are in a small, enclosed cupola situated, by the look of the view through the dingy skylight over your head, on top of the roof of the house. The walls are covered with astrological and astronomical charts with equations and diagrams scribbled across them in crabbed, stilted handwriting. The only exit seems to be an oddly-angled corridor to the southeast.

Dominating the center of the room is a large mounted telescope, pointed almost straight up through the skylight.

>push wall
You can't see any such thing.

>examine charts
Most of the charts seem to be plotting the trajectory of some comet you've never heard of, as it gradually approaches the solar system over the course of several centuries. According to this, the comet is due to arrive...

Well, that's interesting. According to this, the comet is coming tomorrow.

>read charts
Most of the charts seem to be plotting the trajectory of some comet you've never heard of, as it gradually approaches the solar system over the course of several centuries. According to this, the comet is due to arrive...

Well, that's interesting. According to this, the comet is coming tomorrow.

>examine telescope
Constructed of some greenish metal, the telescope consists in the main of an unadorned cylinder about eight inches in diameter, with an eyepiece near the bottom. Near the top, about six inches down from the telescope's upper end, is a thin, rectangular slot, cut horizontally into the side of the cylinder.

>look through telescope
The sky is too overcast; you can't see anything other than a blank, gray circle of solid clouds.

>examine equations
Most of the charts seem to be plotting the trajectory of some comet you've never heard of, as it gradually approaches the solar system over the course of several centuries. According to this, the comet is due to arrive...

Well, that's interesting. According to this, the comet is coming tomorrow.

>search charts
You find nothing of interest.
